

PRIMER

STRUCTURAL PRIMER

Based on a formulation that features tough alkyd resins, this cost-effective structural primer is a great choice for protecting all internal steel structures.

Available in 'Dark Grey' or 'Red Oxide', STR Structural Primer is a fast drying, alkyd zinc phosphate primer that provides strong anti-corrosive properties when applied over suitably prepared steel substrates. It has been specifically formulated for use on a wide variety of steel substrates, such as structural steel, mild steel, piping and equipment and tank exterior surfaces. It's typically used to prime internal steel structures (factories, sheds, etc) where it does not require a topcoat.

STR Structural Primer can be overcoated with an alkyd topcoat, such as ACE Acrylated Enamel, RDE Rapid Dry Enamel, PET Performance Enamel Topcoat and HFE Hammer Finish, from the Commercial Performance Coatings range. A choice of two reducers - normal (Normal) and hot (Slow) - make it easier to effectively deal with various application conditions or job sizes.
